ABSRACT OF THE DISCLOSURE

A nozzle is provided including with a nozzle body having an inlet for receiving liquid, an outlet for dispensing liquid, and a liquid passage extending between the inlet and the outlet. The nozzle includes a valve assembly adapted to selectively control the flow of liquid through the liquid passage. The nozzle further includes a latch stem including a latch groove and a pivot and a lever pivotally attached to the latch stem adjacent the pivot, wherein the latch stem may be selectively locked with respect to the nozzle body to provide an operable pivot to facilitate actuation of the valve assembly by the lever, and wherein the latch stem may be selectively unlocked with respect to the nozzle body to release the pivot to hinder actuation of the valve assembly by the lever.
